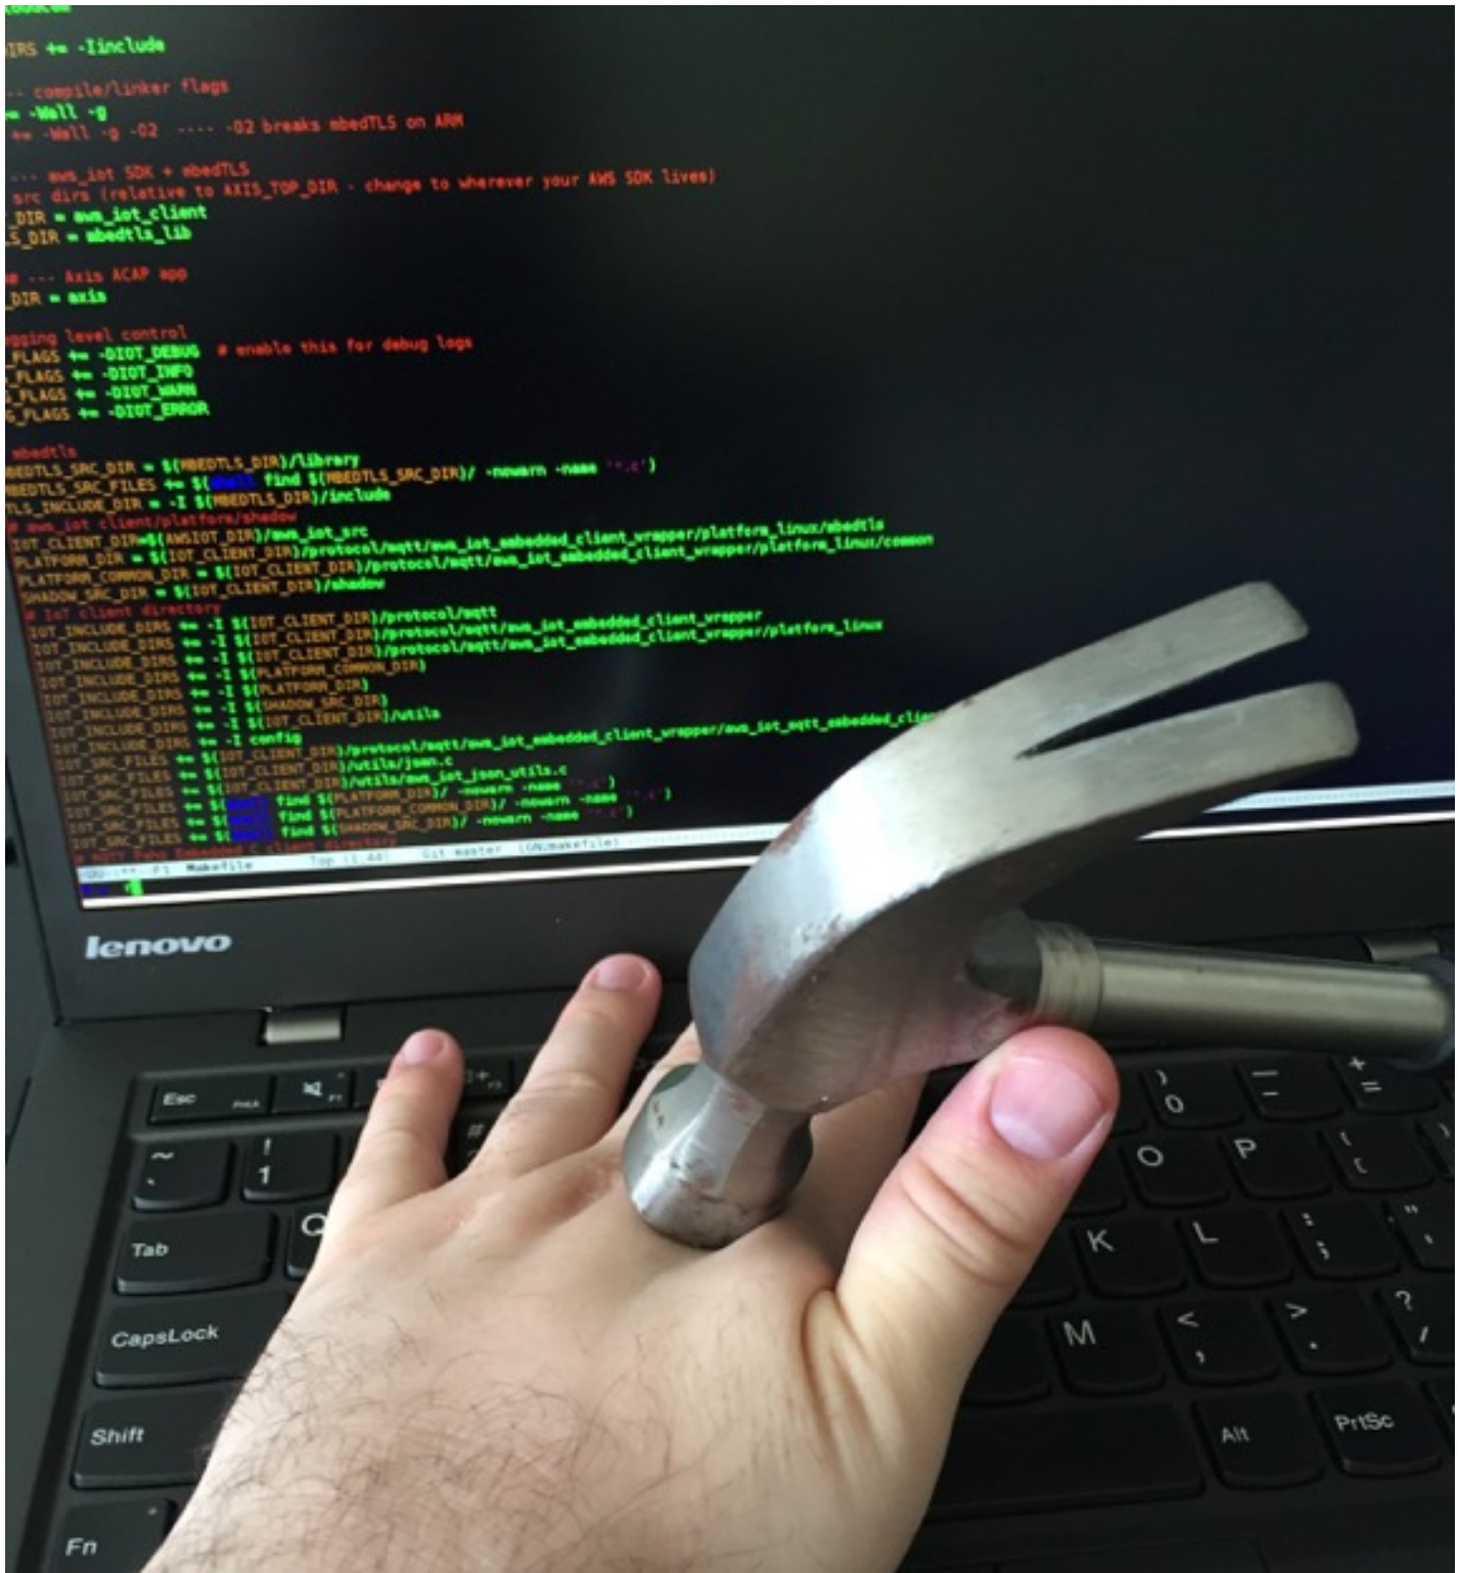
Your Problems

you’ve heard this before

Magical problem-fixing tool!



What is the ☁️?

Datacenter with buttons?
Buzzword?
Something different?

Not total hype

≠ Datacenter

pbuckley> Cache all the things
pbuckley> Consider the flow of a request thru the system. Client to api, api to db. This basic flow has at least three points of fail
networks, HTML5 application cache, etc)
pbuckley> Consider a fall-back static object cache that enables a safe mode level of functionality in case of DB failure
pbuckley> Design your system so that you pay for failure without giving the appearance of being down or unavailable
pbuckley> Not all of the user experience require sync with the back-end
pbuckley> Fast and flexible
pbuckley> No upfront investment
pbuckley> Better precise cost control over the resources you NEED
pbuckley> This is not your father's datacenter
pbuckley> You don't control the network, you ask nicely
pbuckley> You can't buy an extra power supply
pbuckley> You can't buy a diesel generator
pbuckley> You can't build a crazy raid storage device (Think Hitachi USPv 5 chassis SAN, yeh nope)
pbuckley> If you try to compensate in the same ways as you would in a datacenter, your costs will run out of control
pbuckley> AWS can and does fail
pbuckley> April 21, 2011 June 29, 2012 October 22, 2012 December 24, 2012 aws outages (software bugs, human error, thunderstorms)
pbuckley> Embrace failure. Your instance will randomly fail. API's will become unavailable. Your strengths are different then in a da
pbuckley> Define what your availability requirements are going to be and design your solution around it.
pbuckley> Consider the flow of a request thru the system. Client to api, api to db. This basic flow has at least three points of fail
pbuckley> Many small nodes versus a few larger nodes. A larger pool of small nodes that has a single node fail will take away less %
pbuckley> CAP Theorem lives. Choose eventual consistency and availability.
pbuckley> Some gotchas with the subsystems
pbuckley> S3 is awesome. Not fast, but speed remains consistent when many nodes are hitting it. Compress everything. Use lzo for hado
pbuckley> Autoscale is beautiful, not only because of what it does, but due to the architectural constraints it places on you. Your b
pbuckley> Elastic load balancers take a little while to warm up. They don't support web sockets without tcp pass through. Though othe
pbuckley> Global load balancing is your friend (DNS, personal plug for Dynect). Don't depend on the uptime of a single avaibility zon
pbuckley> Use identity manager roles for access. Give least privelage. Setup accounts by app and user
pbuckley> Don't try to send email from an instance. Many of them have been blacklisted by RBLs. Instead use simple email service.
pbuckley> Cloudformation can be cool, templating language is finicky and doesn't support comments. Investigate use of fog (ruby) or b
pbuckley> ELB -> ELB x N Too support cool things like having the ability to remove pools of machines for canary deploys
pbuckley> Manage costs!
pbuckley> Elastic map reduce + Spot instances or redshift is typically cheaper and requires less engineering hours then running your
pbuckley> Prices and features vary by region
pbuckley> Age out files stored in S3 to glacier. They are still visible thru the S3 api.
pbuckley> Investigate instance marketplace, potential to buy instances to get upfront savings without going with reserved instances.
pbuckley> Reserved instances have a higher upfront cost but will eventually be cheaper if the instance capacity is used over n time.
pbuckley> Maximize IOPS, use tricks like compression to reduce the amount of data that needs to be read off disk
pbuckley> Use m1.xlarge or c1.xlarge or ssds and raid 0 ephemeral drives for cheaper fast IOPS
pbuckley> EBS optimized, provisioned iops for more expensive but "promised" IOPS. Increases the number of failure points. EBS has a h
pbuckley> AWS is a nickle and dime economy, watch out or it will take your leg.

CodeDeploy

Alarm:workers-outstanding

Details | History

State Details: State changed to ALARM at 2016/04/11. Reason: Threshold Crossed: 5 datapoints were greater than or equal to the threshold (100.0). The most recent datapoints: [554.0, 660.0].

Description:

Threshold: PMI >= 100 for 5 minutes

Actions:
In ALARM:
- For group **prod-worker** use policy **outstand-scale-up** (Add 2 instances)

In OK:
- For group **prod-worker** use policy **outstand-scale-down** (Remove 1 instance)

Namespace: WorkersOutstanding

Metric Name: PMI

Dimensions:

Statistic: Maximum

Period: 1 minute
